Foreword

This preliminary document defines the Level One GLAS standard data products. This Standard Data Products Specification is developed under the structure of the NASA STD-2100-91, a NASA standard defining a four-volume set of documents to cover an entire software life cycle. Under this standard a section of any volume may, if necessary, be rolled out to its own separate document. This document is a roll out of the GLAS ESDIS Software Detailed Design Specification under the Product Specification Volume.

The GEOSCIENCE LASER ALTIMETER SYSTEM (GLAS) is a part of the EOS program. This laser altimetry mission will be carried on the spacecraft designated EOS ICESat (Ice, Cloud and Land Elevation Satellite). The GLAS laser is a frequency-doubled, cavity-pumped, solid state Nd:YAG laser.

This document addresses the data flow, interfaces, record and data formats associated with the GLAS Level 1 standard data products. GLAS Level 1 standard data products are composed of Level 1A and Level 1B data products. The term “standard data products” refers to those EOS instrument data products listed in the Earth Science Data and Information System (ESDIS) Project data base that are routinely generated within the EOSDIS Distributed Active Archive Center (DAAC) or Science Computing Facilities (SCFs). Each data product has a unique Product Identification code assigned by the EOS Senior Project Scientist.

Level 1A and Level 1B Data Products are composed from those Level 0 data that have been reformatted or reversibly transformed to corrected and calibrated data in physical units at the full instrument rate and resolution.

This document was prepared by the Cryospheric Sciences Branch at NASA GSFC/WFF, Wallops Island, VA, in support of B. E. Schutz, GLAS Science Team Leader for the GLAS Investigation. Purpose and Description of the Data Products

3.1 Purpose of the Data Products

The purpose of the GLAS Level 1 Standard Data Products is to provide the initial reduced GLAS instrument data to the GLAS Science Team and to provide input to the Level 2 data product generation. The GLAS Level 1 Data Products are monitored for data quality and instrument performance. The GLAS Level 1 Data Products are available to the EOS data user community for analysis purposes from the EOSDIS DAAC product storage facility.

3.2 Description of the Data Products

Table 3-1 identifies the Level 1 Data Products. The data products are integer-binary format files containing fixed-length records. Each data record consists of several data elements. An element is either an Item or an Array of Items. The elements are measurements and associated correction values obtained from specific GLAS science algorithm sets. The data products will be formatted in scaled integer binary format with both attached and unattached metadata containing identification, processing history, and data descriptive information.

Figure 3-1 illustrates the source Level 0 data being processed to generate the Level 1 Data Products on the I-SIPS (ICESAT Science Investigator-led Processing System). The GLAS science data processing software transforms the instrument data into the appropriate time-ordered, along-track 1064 nanometer and 532 nanometer Level 1A and Level 1B data parameters and elements. Additional Level 1A science processing algorithms retrieve the GPS receiver data and stellar reference system data and include in the Level 1A product file records. Instrument engineering monitor data along with derived calibration data items are recorded. The Level 1 Data Products are recorded with sufficient detail so as to allow the recovery of the original input elements. In support of the GLAS Science Team, the GLAS Operations Team performs quality assurance at the I-SIPS and returns data quality and descriptive metadata to EOSDIS for incorporation in the EOS data base system.

The specific details of the data product structure, content, format, and data element details will be presented in Section 6. Data sizing, storage burden, and physical media details are provided in Section 5.

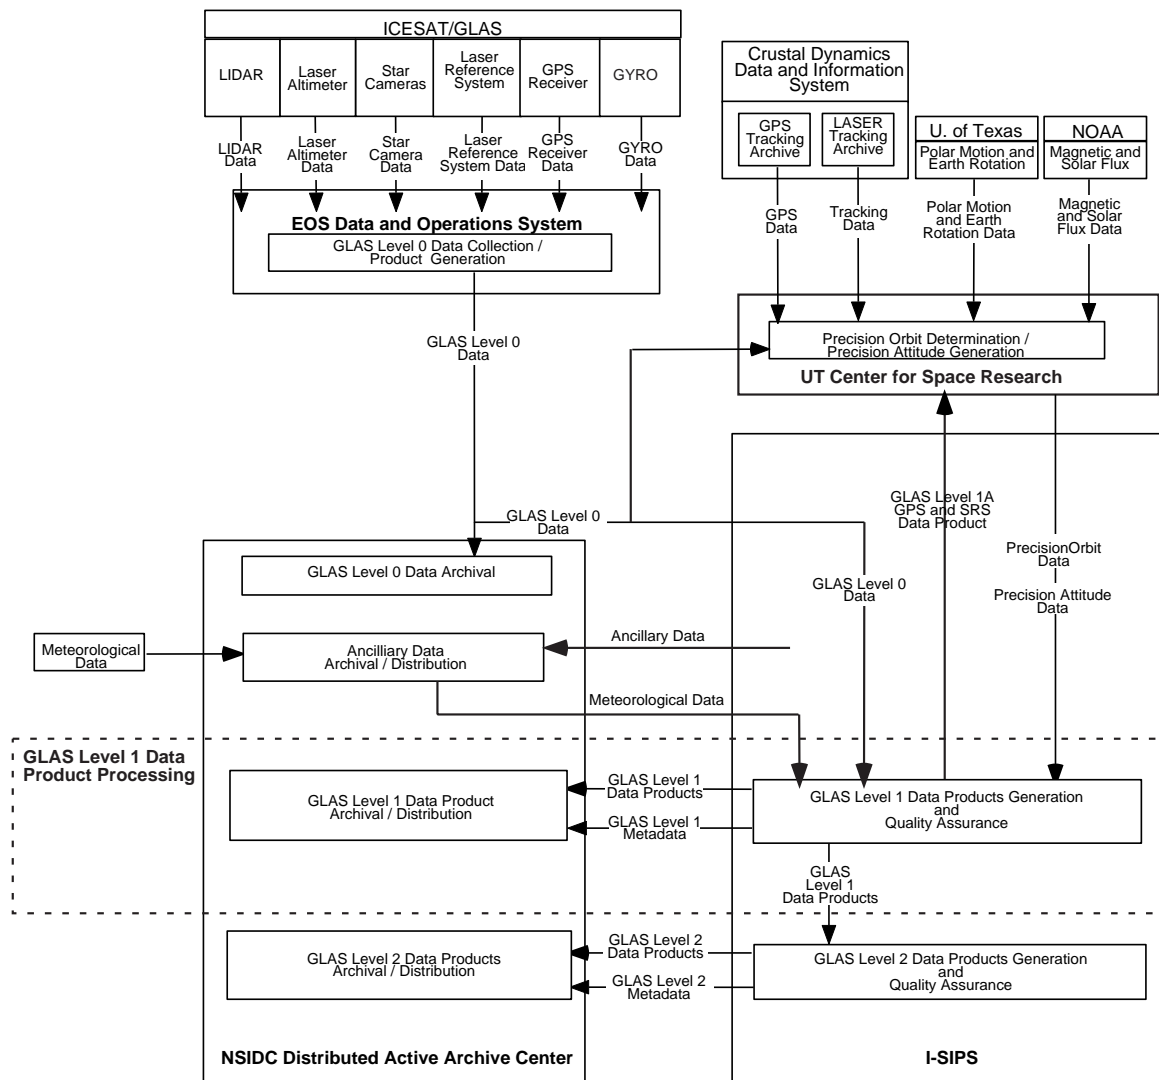

Figure 3-1 Level 1 Data Products Within the Processing Hierarchy

Section 4

Environment

4.1 Hardware Characteristics and Limitations

The required input to the software that creates the Level 1 Data Products is the GLAS Level 0 instrument and spacecraft telemetry data. The Level 0 data is available from EDOS in Production or Expedited Data Sets. The GLAS Level 1A and Level 1B Standard Data Products will be generated on the I-SIPS.

The I-SIPS consists of distributed UNIX operating system-based computers operating under the standard UNIX environment that support the GLAS Science Team operations including the standard data product generation and quality assurance monitoring. The GLAS Level 1A and Level 1B Data Products and their metadata (including QA data) are archived at the DAAC. The Level 1A and Level 1B associated data description and support information are included in the EOSDIS data base to facilitate EOS client inquiry and retrieval activities. The distribution management function of the DAAC allows clients to perform direct search and access of the Level 1A and Level 1B data or to request preparation of Level 1 Data Products.

4.2 Data Products Medium and Characteristics

The Level 1 Data Products will be delivered to the DAAC and archived under the Earth Sciences data collection within the DAAC's data storage and archival subsystem. The storage system will contain not only the Level 1 Data Products, but will also contain data descriptions and data advertisements (i.e., textual descriptive and abstract information, also called metadata).

The Earth Science data are implemented in the current-EOSDIS system through a hierarchical storage manager interface. Physical media supported by the storage system interface will include the disk storage subsystems, magnetic or optical media subsystems, and tiered archive robotics storage subsystems. EOSDIS clients can directly access the GLAS Level 1A and Level 1B data from the DAAC and can copy the data products to their host processors.

The Level 1 Data Products will be available to the GLAS Science Team through the ICESat SCF. See Information Document 2.3e for a detailed description of the ICESat SCF.

4.3 Protocol and Conventions

Protocols and conventions specific to the GLAS SCF will be developed by the GLAS Science Team and documented in the SCF Plan [Information Document 2.3e]. When interfacing to the DAAC, the I-SIPS will comply with procedures, conventions, and protocols as defined by the EOSDIS.

Data definition terminology specific to the GLAS Level 1 Data Products is presented in the Glossary at the end of this document. Figure 4-1 “Data Representation” depicts a schematic of the standard data representations used in the GLAS Level 1 Data Products. These data structures will be used in the Section 6.0 generic data description and in the Appendix C detailed data description of the GLAS Level 1 Data Products.

Data Types, Sizes, and Representations

Conventions: byte 0 is the most significant byte (MSB)
bit 0 is the least significant bit (lsb)
S = the sign bit

Figure 4-1 Data Representation

4.4 Failure Protection, Detection, and Recovery Features

The team supporting operations at the I-SIPS will be responsible for failure protection, detection, and recovery of the GLAS Level 1A and Level 1B Data Products stored on the I-SIPS. Initial GLAS Level 1A and Level 1B Data Products error detection is performed during product generation as part of the product and processing quality assurance activity. The GLAS Level 1A and Level 1B Data Products will be “backed up” under the routine operational functions performed at the I-SIPS. In the event of failure or error detection in the active working or archive storage, recovery would be performed from backup media or from the EOSDIS DAAC archive.

The EOSDIS will be responsible for failure protection, detection, and recovery of the GLAS Level 1A and Level 1B Data Products archived at the DAAC.

Data Flow Characteristics

5.1 Volume, Size, and Frequency Estimates

The expected daily data storage burdens for the GLAS Level 1A and Level 1B Standard Data Products are listed in Table B-3. This estimate is based on the following EOS ICESat operational assumptions. The spacecraft will orbit the Earth at an inclination of 94 degrees and a nominal altitude of 600 kilometers in a circular orbit. The orbit (groundtrack) repeat cycle is approximately 91 days based on a frozen orbit. The EOS ICESat orbit period is approximately 100 minutes resulting in just under 15 orbits per day.

5.2 Data Transfer and Transmission

The GLAS Data Products and associated descriptive metadata will be delivered to the EOSDIS DAAC archival facility through the EOS Science Network access arrangement or off-line via storage media. The GLAS Level 1A and Level 1B Data Products delivered to the DAAC processing subsystem will be designated for fail-safe functions. The GLAS Science Team will have access to the GLAS Level 1 Data Products through the GLAS SCF using TCP/IP and standard UNIX command operations.

Data access procedures to retrieve the GLAS Level 1A and Level 1B Standard Data Products from the EOSDIS DAAC will be provided by the EOSDIS DAAC.

5.3 Timing and Sequencing Characteristics

The GLAS Level 1A and Level 1B Standard Data Products are generated as product files consisting of processed Level 0 data. The basic aggregation of the GLAS Level 1 Data Products is the descriptive information in the header records and GLAS Data Elements in the data records. Records consists of one-second of reduced GLAS instrument, GPS receiver and stellar reference system data, and location data. The exception is the Engineering Data File (GLA03) with records that span 16 seconds. The data parameters and elements contained within the records are groups of forty hertz, five hertz, and one hertz rate data.

All data records within the GLAS Level 1 Data Product files will be in ascending time order based on the first pulse time tag or the first sample time tag. All parameters and elements contained within the records are synchronous at either forty hertz, five hertz, or one hertz. The GLAS instrument and the EOS ICESat spacecraft are expected to operate continuously for at least three years with a goal of five years.

5.4 Recipients and Utilization

The GLAS Science Team and the EOSDIS DAAC are the initial recipients of the Level 1 Data Products. At the I-SIPS, the Level 1 Data Products will be used to generate the Level 1 metadata and the Level 2 Data Products. The metadata (delivered to the EOSDIS DAAC) will include data quality evaluation and statistical reporting on the GLAS Level 1 Data Products to quantify and qualify the products for EOS community usage. The GLAS Science Team will use the Level 1 Data Products for research and analysis.

The subsequent audience for the GLAS Level 1 Data Products is the scientific, governmental, and educational community sectors who will obtain the products from the EOSDIS DAAC.

5.5 Access

The GLAS Level 1 Data Products will be available to the GLAS Science Team from the GLAS SCF. Access to the GLAS SCF is controlled by the GLAS Science Team.

While EOS is intended to be a globally available and utilized mission program, access to the data is still operated under a security and integrity program to protect the data and data system resources from unauthorized or destructive use. Procedures for data access are defined by the EOSDIS DAAC.

Section 6

Appendix A

Level 1 Data Products - Standard Label

Contents & Description

GLAS Products begin with ASCII header records containing information regarding the processing which created the Product and the data contained within. These header records are exactly the same size as a Product data record and contain ASCII information in a slightly modified KEYWORD=VALUE format. In order to conserve space on the product, the header records contain multiple KEYWORD=VALUE entries and entries are delimited by a semi-colon (;) and linefeed (ASCII 10).

By design, the first two header entries are the record length and number of header records. This allows product readers to verify the record length and jump directly to the first data record, if necessary. Most of the remaining information within the headers is directly applicable to the generation of metadata files for EOS ingest.

The following fields are defined for GLAS Product Headers:

Level 1 Data Product Formats

C.1 Record Formats

C.1.1 Guidelines

The GLAS Data Product record formats were developed under the following guidelines:

- 1) Record size a multiple of 4. 
- 2) Start elements on a 4 byte boundary; where not possible use pads or group smaller elements together to get to 4 byte boundary. Pad and move elements so that arrays start on 4 byte boundaries. 
- 3) The output structures to build files should be grouped in descending size order, therefore group elements on file logically and in descending size order. 
- 4) Data that occurs occasionally in the file should be put in the header. Specifically, data that are changing at a much lower rate than the record rate on the files, will be put in the header. These elements will not be shown in the record format.
- 5) Add spares.

C.1.2 GLA01

Fixed length, variable format records. For each second of data there is a main record and a varying number of long or short waveform records each denoted by the GLA01 record type field (i_gla01_rectype). Record type "0" is a main record, record type "1" is a long waveform record, and record type "2" is a short waveform. The main record contains all of the altimetry waveform information except that which is directly associated with the return waveform. Succeeding records in sets of either 2 for ocean or 5 for land, as determined by the on-board surface type mask, contain the return waveforms. Long, or land waveform records contain eight 544 sample returns and data. Short, or ocean records contain twenty 200 sample waveforms and associated data.

Product Data Type: ilb
Total Bytes: 1

Invalid Value/Flag: No
Is Correction Flag?: NA
Is Unsigned?: No
Product Minimum: 0
Product Maximum: 15

Description: The multiple scattering warning flag (MSWF) is based on the total column optical depth (aerosol plus cloud) calculated in GLA11 using 532nm. It is intended as a way to quickly obtain information about the potential severity of multiple scattering with regards to the range-to-surface calculated by the altimetry processing software. It will be output on the GLA11 product for use by the altimetry group. The multiple scattering warning flag will have values ranging from 0-14, based on the total column optical depth as detailed in the PDF.

A warning flag value of 15 will signify 'invalid'. An invalid will be encoded if an optical depth in any of the layers in the 1-second column could not be calculated. This usually occurs in a very optically 'thick' cloud which extinguishes the signal. It could also occur if the extinction-to-backscatter ratio assignment is set too high, causing the transmission calculations in the lidar inversion to go out-of-range. Please see [the PDF flag description](flags/i_cld1_mswf_elv.pdf) for more details.

E.1 Design Philosophy

GSAS flag design is governed by a consistent philosophy. Per HP documentation, bits are numbered right to left starting at 0. E.g., a byte has the following bit numbers:

However, arrays of bytes are numbered left to right starting at 1. The direction from which shots are incremented depend if the flag is a byte flag or bit flag. Byte flags increment from left to right, bit flags increment from right to left. This follows the "natural" big endian ordering scheme. E.g.:

BIT flags increment from right to left: 

BYTE flags increment from left to right:

The following section contains detailed descriptions of each flag found in the GSAS Level 2 products. The descriptions are ordered alphabetically.

Note: i_statflags is a 4 byte flag. Each 4 byte flag, corresponds to 1/40 of a second measurement. There are multiple types of subrecords in GLA01; GLA01_long and GLA01_short. Each type contains a specific number of subrecords; GLA01_long contains 5 records per second and GLA01_short contains 2 records per second. Therefore, i_statflags will be represented by 8, 4 byte flags, in GLA01_long for each of the 5 records (40 total flags) and represented by 20, 4 byte flags, in GLA01_short for each of the 2 records (40 total flags). The first 4 byte flag in the first subrecord corresponds to the first 1/40 second of data.

i_cld1_mswf [GLA06, 12-15]: Multiple Scattering Warning Flag

4 bit set of values;

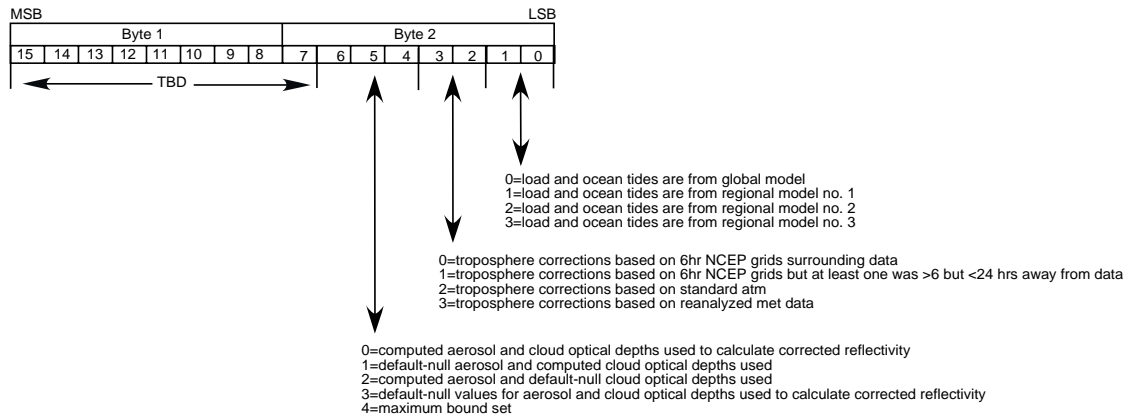

0	= < 0.010
1	= 0.010 - 0.030
2	= 0.030 - 0.060
3	= 0.060 - 0.100
4	= 0.100 - 0.150
5	= 0.150 - 0.225
6	= 0.225 - 0.300
7	= 0.300 - 0.400
8	= 0.400 - 0.500
9	= 0.500 - 0.670
10	= 0.670 - 0.900
11	= 0.900 - 1.200
12	= 1.200 - 1.600
13	= 1.600 - 2.000
14	= > 2.000
15	= Invalid

Note: A warning flag value of 15 will be the default whenever no 532nm signal is available (as when the 532 laser energy is < 4 mJ during daytime). To distinguish this case from that of optically thick clouds, one must check the number of layers. If there were zero layers reported, but the MSWF is 15, then the cause is the lack of useable 532 data. If the number of layers is > 0 and the MSWF is 15, then the cause is total extinction of the lidar beam (this happens for clouds of optical depth > about 3).

A warning flag of '0' is a very good indicator of no layers or a layer so thin it won't cause any altimetry range delays.

Figure E-38 High Resolution Source Flag**i_MRC_af [GLA06, 12-15]: Medium Resolution Cloud Availability Flag**

Tells how many cloud layers were found at this resolution. Glossary

aggregate	A collection, assemblage, or grouping of distinct data parts together to make a whole. It is generally used to indicate the grouping of GLAS data items, arrays, elements, and EOS parameters into a data record. For example, the collection of Level 1B EOS Data Parameters gathered to form a one-second Level 1B data record. It could be used to represent groupings of various GLAS data entities such as data items aggregated as an array, data items and arrays aggregated into a GLAS Data Element, GLAS Data Elements aggregated as an EOS Data Parameter, or EOS Data Parameters aggregated into a Data Product record.
array	An ordered arrangement of homogenous data items that may either be synchronous or asynchronous. An array of data items usually implies the ability to access individual data items or members of the array by an index. An array of GLAS data items might represent the three coordinates of a georeference location, a collection of values at a rate, or a collection of values describing an altimeter waveform.
file	A collection of data stored as records and terminated by a physical or logical end-of-file (EOF) marker. The term usually applies to the collection within a storage device or storage media such as a disk file or a tape file.
header	A text and/or binary label or information record, record set, or block, prefacing a data record, record set, or a file. A header usually contains identifying or descriptive information, and may sometimes be embedded within a record rather than attached as a prefix.
item	Specifically, a data item. A discrete, non-decomposable unit of data, usually a single word or value in a data record, or a single value from a data array. The representation of a single GLAS data value within a data array or a GLAS Data Element.
label	The text and/or binary information records, record set, block, header, or headers prefacing a data file or linked to a data file sufficient to form a labeled data product. A label may consist of a single header as well as multiple headers and markers depending on the defining authority.
Level 0	The level designation applied to an EOS data product that consists of raw instrument data, recorded at the original resolution, in time order, with any duplicate or redundant data packets removed.
Level 1A	The level designation applied to an EOS data product that consists of reconstructed, unprocessed Level 0 instrument data, recorded at the full resolution with time referenced data records, in time order. The data are annotated with ancillary information including radiometric and geometric calibration coefficients, and georeferencing parameter data (i.e., ephemeris data). The included, computed coefficients and parameter data have not however been applied to correct the Level 0 instrument data contents.
Level 1B	The level designation applied to an EOS data product that consists of Level 1A data that have been radiometrically corrected, processed from raw data into sensor data units, and have been geolocated according to applied georeferencing data.

Level 2	The level designation applied to an EOS data product that consists of derived geophysical data values, recorded at the same resolution, time order, and geo-reference location as the Level 1A or Level 1B data.
Level 3	The level designation applied to an EOS data product that consists of geophysical data values derived from Level 1 or Level 2 data, recorded at a temporally or spatially resampled resolution.
Level 4	The level designation applied to an EOS data product that consists of data from modeled output or resultant analysis of lower level data that are not directly derived by the GLAS instrument and supplemental sensors.
metadata	The textual information supplied as supplemental, descriptive information to a data product. It may consist of fixed or variable length records of ASCII data describing files, records, parameters, elements, items, formats, etc., that may serve as catalog, data base, keyword/value, header, or label data. This data may be parsable and searchable by some tool or utility program.
orbit revolution	The passage of time and spacecraft travel signifying a complete journey around a celestial or terrestrial body. For GLAS and the EOS ICESat spacecraft each orbit revolution count starts at the time when the spacecraft is on the equator traveling toward the North Pole, continues through the equator crossing as the spacecraft ground track moves toward the South Pole, and terminates when the spacecraft has reached the equator moving northward from the South Polar region.
parameter	Specifically, an EOS Data Parameter. This is a defining, controlling, or constraining data unit associated with a EOS science community approved algorithm. It is identified by an EOS Parameter Number and Parameter Name. An EOS Data Parameter within the GLAS Data Product is composed of one or more GLAS Data Elements.
pass	A sub-segment of an orbit, it may consist of the ascending or descending portion of an orbit (e.g., a descending pass would consist of the ground track segment beginning with the northernmost point of travel through the following southernmost point of travel), or the segment above or below the equator (e.g., either the northern or southern hemisphere portion of the ground track on any orbit).
product	Specifically, the Data Product or the EOS Data Product. This is implicitly the labeled data product or the data product as produced by software on the DAAC or SCF. A GLAS data product refers to the data file or record collection either prefaced with a product label or standard formatted data label or linked to a product label or standard formatted data label file. Loosely used, it may indicate the entire set of product files contained in a data repository.
record	A specific organization or aggregate of data items. It represents the collection of EOS Data Parameters within a given time interval, such as a one-second data record. It is the first level decomposition of a product file.
Standard Data Product	Specifically, a GLAS Standard Data Product. It represents an EOS ICESat/GLAS Data Product produced on the DAAC or on the SCF. It is routinely produced and is intended to be archived in the EOSDIS data repository for EOS user community-wide access and retrieval.
variable	Usually a reference in a computer program to a storage location.
